CHAPTER 1

Welcome to Clarity

Clarity is a desktop trade journal built for futures and forex traders who want real analytics on their trading — not a spreadsheet with a form bolted on, and not a hosted web tool where your trading data lives on someone else's server. Clarity runs natively on your Windows PC, stores your data locally, and offers optional encrypted cloud sync when you want the same journal on more than one machine.

How to read this manual

Chapters 1–5 get you logging and reviewing trades — enough to use Clarity day to day. Chapters 6–10 cover the analytics and psychology tools that make Clarity more than a spreadsheet. Chapter 12's NinjaTrader Auto-Log section is worth reading closely if you run TradePanelPro, since the two are designed to work together. Chapter 14 shows how to let your own AI app read your journal. Chapter 15 is a flat reference to every setting, useful once you already know roughly what you're looking for.

What makes Clarity different

- **Your data stays yours.** Trades are stored in local files on your machine. Cloud Sync, when enabled, encrypts everything with a passphrase only you know before it ever leaves your computer.
- **Psychology is built in, not bolted on.** Execution checklists, behavioural tags, readiness, mood and discipline scoring sit alongside your P&L from the start.
- **Currency is calculated properly.** Historical exchange rates are fetched and locked to each trade, so profit and loss convert correctly into your account currency — for forex pairs and for futures priced in another currency.
- **Multiple trading files.** Keep your live accounts, backtests and strategy variants completely separate, each with its own accounts, strategies and statistics.

Installing Clarity

Run the installer (a file named like `Clarity_3.3.0_x64-setup.exe`) and follow the prompts. Clarity installs like any normal Windows application.

Starting Clarity

Each launch shows a short splash screen with your version number while Clarity checks your licence and opens your data.

Activating your licence

The first time you open Clarity it asks for your **License Key** (it looks like `CLRTY-XXXXX-XXXXX-XXXXX-XXXXX`). Enter it and click **Activate**; this needs an internet connection.

Clarity re-checks the licence each time it starts. If it can't reach the licence server it carries on working: for the first two days nothing changes, on days three and four an amber banner counts down the days remaining, and from day five Clarity stays locked until you are back online.

Each licence can be active on a limited number of computers; trying one more shows "Activation limit reached". To move to a new PC, free a seat yourself in the LucidTicks members area — the Clarity licence page lists your devices with a

Remove button (a device can't be removed within 24 hours of activating it).

Keeping Clarity up to date

When Clarity starts and is online, it checks for a new version. If there is one, an **Update Available** dialog shows the old and new version numbers, with **Read Update Notes** to see what changed.

- **Install** downloads and installs the update, then restarts Clarity — nothing else to do.
- **Remind me in** 3, 7 or 14 days, then **Remind**.
- **Skip** ignores that version.

If you put an update off, a small **Update available** line stays at the bottom of the sidebar — click it to reopen the dialog.

CHAPTER 2

Getting Around

Everything in Clarity is reached from the sidebar on the left, in three groups. Each page is covered in full later in this manual.

Page	What it's for
Dashboard	Account Spotlight (drawdown, target and daily-loss gauges per account), the equity curve, your payoff against win rate, and behavioural insights (Chapter 6).
Journal	Daily, weekly and monthly structured journal entries (Chapter 8).
Log Trade	Add a new trade by hand (Chapter 3).
Trade List	Every trade in the active trading file (Chapter 4).
ANALYTICS	
Performance	Charts and breakdowns by day, week, month, time, instrument and strategy, plus Monte Carlo, Money Management, Excursion (MFE/MAE) and Insights.
Balance Sheet	A year month by month: balance, win rate, drawdown and P&L.
Calendar	A monthly calendar shaded by each day's P&L, with weekly totals.
Filter Stats	Results broken down by account, broker, strategy, instrument, direction and your custom filters.
BEHAVIOUR & TOOLS	
Psychology Corner	Your trader profile, rule adherence, strengths and leaks, mood against money (Chapter 7).

Risk Calc	Position sizing and the Edge Check (Chapter 9).
News Squawk	Live market headlines and the economic calendar (Chapter 10).
Setup	All configuration (Chapter 15).

Trading files and the Active List

Clarity keeps every trading file completely separate — its own accounts, strategies, tags and statistics — so your live trading never mixes with a backtest or an experiment. Once you have more than one file, an **Active List** dropdown appears under the Clarity logo. Whichever file is active is what every page shows. The dropdown's last entry, **— Compare Lists —**, opens a side-by-side comparison of two to four files (Chapter 6).

> **TIP**
> A file marked as a `BACKTEST` shows **Backtest Overview** in place of the Dashboard and hides the pages that only make sense for live trading — Journal, Psychology Corner and News Squawk. Backtest files are marked (BT) in the dropdown.

The Showcase file

Clarity comes with a **Showcase** trading file: a full year of sample futures and forex trades across three accounts, complete with journals, tags and custom filters — so you can see what every page looks like with real-looking data before you have your own. The trades are not real. The Showcase is never included in exports or cloud sync. Hide or show it from **Setup** → **Trading files**; hiding it only removes it from the Active List and deletes nothing. Don't log your own trades into it — an app update can rebuild it.

The sidebar footer

Status lines at the bottom of the sidebar show what's running: **Synced**, **Sync pending** or **Sync disconnected** for Cloud Sync (Chapter 13), and **NT Sync Active** when NinjaTrader trades are being imported (Chapter 12). Click either to open its settings. Below them, the **Light mode** / **Dark mode** button switches the theme (dark is the default, and your choice is remembered).

Display size

Setup → **Preferences** → **Display Size** scales text, spacing and charts together: Auto, 80%, 90%, 100%, 110% or 125%. Auto shrinks things a little when the window is narrow. From anywhere, **Ctrl + =** and **Ctrl + −** change the size and **Ctrl + 0** resets it. The setting applies to this computer only.

CHAPTER 3

Logging a Trade

Log Trade (or **+ New Trade** on the Trade List) opens a new trade on the trade page's **Execution** tab. The other tabs — Overview, Review and Screenshots — unlock after the first save (Chapter 5). The header shows whether the trade will save as Open or Closed; **Continue** saves it and takes you to its Review tab. Leaving without saving asks whether to discard it.

Setup

- **Account** — which account took the trade. In a backtest file this is a virtual account, filled in for you.
- **Instrument** — grouped into Futures and Forex.
- **Strategy** — optional; links the trade to one of your strategies and its checklist.
- **Broker** — used for commission; filled in from the account's broker.
- **Also log on** — tick other accounts to create the same trade on each of them in the same save, each with its own account's broker. Accounts in a different currency are shown but can't be ticked.

Entry

- Long or Short, then **Date**, **Time** and **Timeframe**.
- **Price**, **Stop Loss** and **Type** (Manual Entry, Algo Entry, Copy Traded).
- Size: **Contracts** for futures, **Units** for forex (the raw unit count, not lots). Forex also has a **Swap Fee** field.

For forex, a **Position Size** panel turns a risk percentage into units, showing the standard, mini and micro lot equivalents and your planned against actual risk (amber when they're more than 5% apart). **Use N units** fills in the Units field.

Targets & Excursion

Up to three targets, plus **MFE** and **MAE** (how far the trade went for and against you). The **Trade Risk** box shows your risk in money and as a percentage of the account, and the reward-to-risk to Target 1, live as you type.

Exit & Close

There is no separate Open/Closed choice: a trade is Closed as soon as an exit leg has a price and date, and Open until then. If you scaled out in stages, use **+ Add Exit Leg** for each partial exit — each leg has its own Reason (TG1, TG2, TG3, SL, Manual, Break Even), size, exit price, date and time. Clarity works out the average exit and total P&L across the legs.

FX Conversion

When the instrument's currency differs from the account's — any forex pair quoted in another currency, or a futures contract such as FDAX in a USD account — an FX Conversion panel appears. In **Auto**, **Fetch** pulls the historical rate for the trade's close date (the last exit leg's date) and locks it to the trade. Switch to **Manual** to type a rate from your broker statement. See Chapter 11.

Custom filters

Any custom filters you've named in Setup (session, setup type, confluence…) appear at the bottom of the form. The execution checklist is ticked on the trade's Review tab after saving (Chapter 5).

> **TIP**
> Two gentle warnings may appear while you log: **Possible revenge entry** if your last trade lost and closed less than five minutes ago, and **Overconfidence check** if you're sizing well above your recent average after a winning run. Both can be dismissed.

CHAPTER 4

The Trade List

The Trade List shows every trade in the active trading file. At the top:

- **Show** — 1 Month, 2 Months, 3 Months or All. It opens on 3 Months and then remembers your choice.
- **Expand All / Collapse All** and **+ New Trade**.
- Filter dropdowns — All Accounts, All Instruments, All Strategies, All Status, All Directions — and **Jump to**, which shows a single day.
- The **Daily / Individual** switch at the right-hand end: Daily groups trades by day with a summary row; Individual is a flat list. Backtest files always use the flat list.

Columns

Columns chooses which columns are visible. A few are hidden by default and can be switched on, including **Exclude** (the exclude-from-stats toggle) and **FX Rate** (the conversion rate, Chapter 11).

Editing directly in the list

Most cells can be edited without opening the trade — click the cell: dates and times, prices, stop, targets, exit, MFE and MAE, quantity, commission, timeframe, entry type, strategy, broker, custom filters and, when shown, the FX rate. Clicking the direction cell flips Long and Short. P&L recalculates straight away. If you change the quantity or broker on a trade with a typed-in commission, Clarity asks whether to recalculate the commission first.

> **TIP**
> Editing a cell in the Trade List changes only that one trade — it never updates linked trades. To update a group of linked trades together, edit from the trade page (Chapter 5).

Finding duplicates

Find Duplicates opens the **Duplicate Trade Scan**: trades on the same account with the same entry date, time, price, direction and size. It keeps the earliest trade in each group; **Delete N Duplicates** removes the rest.

Excluding a trade from statistics

Sometimes a trade should stay in your journal for the record but not count toward your stats — a fat-finger error, a test trade, an account correction. Switch on the **Exclude** column and toggle it for that row: the trade is shown struck through and greyed out and left out of your statistics.

CHAPTER 5

The Trade Page

Click any trade to open its page. It has four tabs, and one **Save** in the header saves all of them:

Tab	What's on it
Overview	**Trade Information** — a price ladder of entry, stop and targets, with contracts, risk, price R (the move in units of the stop distance, before commission), planned R:R, reward, MFE, MAE and exit reason — and a summary of your review.
Execution	The full trade form from Chapter 3: prices, size, exit legs, FX conversion.
Review	Your notes, checklist, tags, grade and verdict.
Screenshots & AI Replay	For a NinjaTrader trade, the **AI Replay** of the market around it; then **Screenshots & Markups** — chart images for the trade.

Each tab shows what's left to do — for example Unsaved, FX pending, Open, a tick when complete, or "No screenshots yet". The ← and → arrows move to the previous or next trade on the same tab. Leaving with unsaved changes offers **Stay**, **Leave without saving** or **Save and continue**.

Review: notes, checklist, tags, grade and verdict

- **Trade Observations** and **What to Improve** — free-text notes (with a mic button if Mic Dictation is on, Chapter 8).
- **Execution Checklist** — tick the rules you followed; ✎ **Manage rules** edits the checklist.
- **Trade Tags** — Positive tags (A+ setup, clean execution…) and Negative tags (FOMO entry, revenge trade…), which feed Psychology Corner; ✎ **Manage tags** edits the list.
- **Trade Grade** — A, B or C.
- **Trade Verdict** — Good Trade or Bad Trade, independent of whether it made money.

> **TIP**
> Grade and verdict are judged on process, not outcome. A well-executed trade that loses because the market did something unexpected can still be a good trade — that's the whole point of separating the two.

Screenshots

Drop chart images onto the Screenshots tab, use the **browse** link, or paste: press **Win + Shift + S**, snip the chart, then **Ctrl + V**. The paste area is ready as soon as the tab opens ("Ready — press Ctrl+V to paste a screenshot"). Give each image a label (for example "15m MES chart"), shown with it at full size.

AI Replay

With TradePanelPro 8.9.6 or later recording (the Clarity pill on), every NinjaTrader trade gets a replay of the market around it: the 1-minute bars from 30 minutes before the entry to 10 minutes after the exit, your entry and exits, and the levels of the AI read that was live at entry, with how old that read was. When the replay reaches your entry, a position box opens as it would on a chart — green from entry to your furthest target, red from entry to your stop — and grows with the trade until the last exit, labelled with the entry price and time, the stop and target prices, and where and when the trade closed. Press ▶ to play it bar by bar, step through it, or drag the slider; **Bars** switches between 1 and 30-minute candles. Copied trades share one replay.

The replay is built automatically about 11 minutes after the exit. Until then it shows **Expected by** a time. **Delayed** means the bars haven't arrived — often the market closed for its daily break or the weekend, or NinjaTrader shut down; open NinjaTrader with the pill on and click **Gather data**. **Unavailable** gives the reason — for example a trade from before recording began, or a Playback trade. The Trade Log's **Replay** column shows the same as a coloured dot.

Chart snapshots and the Inbox

TradePanelPro's **Snapshot** button (8.9.6.8 or later) photographs the chart and asks which trade it belongs to. Clarity picks it up within a minute and adds it to that trade's **Screenshots** with its caption — on every account of a copied trade, in whichever trading file the trade is in. A snapshot taken during a trade waits and attaches once the trade arrives; one of an older trade attaches straight away. Snapshots sort by when they were taken. **Rescan snapshots** on the Screenshots card looks again at once.

A snapshot sent as **No trade**, or whose trade isn't found within 7 days, goes to the **Inbox**, which appears in the sidebar with a count while it holds anything. From there attach it to a trade (and its linked trades), to a journal day, or delete it. Change the 7 days under Setup → Import & NinjaTrader. Snapshots Clarity can't read are listed there too and left in Documents\Clarity\shots. Snapshots still waiting for their trade are listed greyed, with the days left; attach one by hand if its trade is in another file or was deleted. Imported snapshots move to shots\done and are deleted after 30 days; the copies on your trades are kept.

Exit legs

Exit legs live on the Execution tab under **Exit & Close**. Editing them recalculates the average exit price and total P&L.

FX rate pending

If a conversion rate couldn't be fetched (for example while offline), a **FX rate pending** banner offers **Retry fetch** or **Enter manually**.

Linked trades

Linked trades are the same trade taken on several accounts — each a separate row with its own real prices and P&L. They come from NinjaTrader copy trading (Chapter 12), from **Also log on** (Chapter 3), or from **Manage accounts** in the trade's **Linked Trades** bar, which opens **Accounts on this trade**:

- **Already in this group** — the accounts linked now.
- **Link an existing trade** — connects a trade that already exists on another account; nothing new is created.
- **Add a copy** — creates a copy on another account when you save.

Saving a linked trade asks **Update linked trades?** — **This trade only** or **Update all N trades**. For trades that came from NinjaTrader, only the review (notes, tags, checklist, grade, verdict, screenshots) is copied across, because each account's fills are real — plus the **FX rate**, to linked trades in the same account currency that closed the same day, so a rate you correct against your broker statement on one trade reaches the rest (a rate you typed on another trade is kept). For trades you linked by hand, prices, dates and exit legs are copied too. Either way each trade's P&L is recalculated with its own commission and exchange rate. A dot on **Save** marks linked trades that are behind.

> **IMPORTANT**
> Choose **This trade only** for anything that should genuinely differ between accounts — such as a hand-corrected FX rate.

CHAPTER 6

Performance & Analytics

Dashboard

- **Account Spotlight** — a card per account with Drawdown, Target, Daily loss and Consistency gauges and an OK / Watch / At risk badge (limits come from Setup → Accounts). The gear shows or hides accounts.
- **Equity Curve** and **Payoff vs Win Rate** — your average reward-to-risk, the win rate it needs to break even, your actual win rate, and whether you are profitable on structure.
- **Behavioural Insights** — What's Costing Me Money, What's Making Me Money, Discipline, Process Compliance, Current Streak and Latest Learning.
- A readiness banner when today's journal shows poor sleep or high stress.

The Filter Sidebar

Performance, Balance Sheet, Calendar and Psychology Corner share a Filter Sidebar, opened and closed with its arrow tab ("Show filters" / "Hide filters"). Sections: Direction, Account, Strategy, Instrument, Entry Type, your custom filters, Day of Week, Month of Year and — once your data spans more than one year — Year. Filters work like an Excel slicer: click a value to toggle it, and an empty section means "show nothing" for that dimension, so you always know what you're looking at. **Clear** resets every section; the gear chooses which sections appear. **Tag these N trades…** names the current selection so you can bring slices back together later — for example shorts under one rule and longs under another, as one equity curve.

Performance page

Tabs along the top: **Overview**, By Day, By Week, By Month, By Year, By Time, By Instrument, By Strategy, **Monte Carlo**, **Money Management**, **Excursion** and **Insights**.

- **Overview** — the charts chosen from the gear menu (Cumulative P&L, Daily P&L, Rolling Win Rate over the last 20 trades, and the Break-Even Curve of win rate against reward-to-risk, with your position marked), then Performance

and Streaks & Drawdown tables split Longs / Shorts / Total, Recovery Needed (the gain needed to climb back from your worst drawdown), and win/loss distribution and streak charts.

- **The By… tabs** chart P&L and trade count for each group, with a Net / Gross switch.
- **Money Management** replays your trades under three sizing schemes — Actual, Fixed and Money managed — against your account's drawdown limit. Set the scheme at the top; hover any setting's heading for what it does.
- **Excursion** combines MFE and MAE — the best and worst price each trade reached — across the filtered trades, in R (the move divided by the distance to your stop). A line at the top says how many trades it could use and why the others were left out (no values, no stop, or prices that cannot be right). Copies of one trade on several accounts count once. Tiles show how far winners and losers went for and against you, and the **Let-It-Run Ratio**: how much of the best price your winners kept. Two charts plot each trade's heat and its best price against where it closed (click a dot to open the trade), a table shows how many winners stayed within a tighter distance and how many losers were in profit first, and **Worth a look** lists patterns once 20 or more trades are behind them. Hover any heading for what it means.
- **Insights** reads your tags, checklist and mood data and lists findings and Nudges (live files only).

Monte Carlo

Your result is one path through your trades — Monte Carlo shows the others. Hover any of its buttons for what it does.

- **Reshuffle order** plays your trades in many different orders. The total is the same in every run — order can't change it — but the journey isn't: how deep your worst drawdown could have been, how long your losing run, and how often this edge would hit your account's drawdown limit.
- **Resample trades** builds new histories by drawing trades at random from yours, repeats allowed, so the ending changes too — the range of results this edge could plausibly have produced.
- **Measure in R or $.** R divides each trade's net P&L by the risk to its stop, so your past sizing doesn't distort the result — but trades without a stop are left out (the line under the buttons says how many, and why). $ uses every trade as booked; it refuses to mix accounts in different currencies. In R, your drawdown limit is converted with **1R =**, filled in with your median risk per trade — change it to the risk you mean to trade.

The fan chart shows your actual curve against the range covering 90% of runs; the tiles give your worst drawdown, longest losing run and final result against "1 run in 20", and the chance of hitting your limit — your account's Max Drawdown from Setup → Accounts, so filter to one account to see it. The last chart lines up every run's worst drawdown from the mildest to the worst, with yours at its rank ("980th of 1,000") and your limit across it — hover its ? for the plain odds at round amounts. It uses the trades the Filter Sidebar selects, needs at least 20, and **Run again** draws a fresh set.

> **IMPORTANT**
> It treats each trade as independent of the last, so it can't see tilt after a loss or a market changing character — a real losing run can be worse than any shuffle of your history. Filter to a period that reflects how you trade now.

Balance Sheet

One year, month by month, for whatever the Filter Sidebar selects (‹ › change the year). A Year to date summary and month-end equity curve sit above tiles for win rate, profit factor, payoff ratio, average trade, maximum drawdown and best/worst month; the table below runs through activity, quality, per-trade figures, extremes, gross and net, to each month's total P&L and end-of-month balance.

Calendar

Each day is shaded by its P&L — deeper for bigger days, on a fixed scale so days compare across the year — and shows P&L, trade count, win rate and dots for behaviour tags. A Weekly column carries each week's total and a small equity curve. Click a day or week to see its trades. The banner shows P&L by month and the month's key tiles; **Show Weekends** adds Saturday and Sunday.

Filter Statistics

Results broken down by Account, Broker, Strategy, Instrument, Trade Direction and each of your custom filters — Total, Wins, Losses, Breakeven, Win Rate and Net P&L. Three **Priority Filters** (up to ten — add or remove them with **+** and **−**) narrow every table and are remembered per trading file until **Reset Priority Filters**. Define "Session" once as a custom filter, tag every trade London / New York / Asia, and this page shows win rate and P&L for each.

Compare

Opened from the Active List's **— Compare Lists —**. Choose two to four trading files (**+ Add List**) to see each one's equity curve, net P&L, trade count, win rate and about twenty more metrics side by side — a live account against a backtest, or two strategy variants.

Combine adds one more card joining the selected files' results — for example two accounts kept in separate files, seen as one. It's temporary: nothing is merged or saved, and the files stay separate. Files holding accounts in different currencies can't be combined; mixing live and backtest, or including the Showcase, is flagged; and a trade logged in more than one of the files is counted once per file. Trades marked Exclude are left out of every Compare card.

Backtest Overview

On a backtest file, in place of the Dashboard: pick a strategy to see Net P&L, Win Rate, Profit Factor, Expectancy and Max Drawdown, the equity curve, monthly and day-of-week P&L, and Long/Short cards. **What separated results** calls a filter "a real difference" only when the gap is unlikely to be luck, and lists the rest as "too close to call yet".

CHAPTER 7

Trading Psychology

Psychology Corner pulls together everything Clarity has recorded about *how* you traded, not just how much you made. It uses the Filter Sidebar (Chapter 6).

- **Trader Profile** — a radar of your process.
- **Process × Outcome** — your trades sorted into Good Winners, Bad Winners, Good Losers and Bad Losers, with **Rule Adherence** and **Clean Trades** tiles.
- **Discipline Trend**, **Tired-Day Cost**, **Optimal Non-Trading**, **Hold-Time Discipline** and **Drawdown Behavior Shift**.
- **Rule adherence** — grouped by strategy, rule by rule, with the average P&L when each rule was followed against when it was skipped.
- **Strengths** and **Leaks** — your positive and negative tags, how often they appear and what they cost or earn. Click a row to open the Trade List showing just the trades that row counted; its other filters pause until you click ✕ **Clear**.

- **Mood × Money** — average P&L for each logged emotion, and results by discipline band.

Negative tags carry a category — fear, greed, hope or regret — which Psychology Corner groups by. Nudges about your behaviour live on **Performance** → **Insights** (Chapter 6).

The Execution Checklist

Set up in **Setup** → **Strategies & rules**. Each strategy has its own rules; a strategy with none of its own uses the **Global default** rules. You tick the checklist on each trade's Review tab, and those ticks drive rule adherence here.

Bad winners

A trade that won despite breaking your rules is counted as a **Bad Winner** — a reminder that a lucky outcome doesn't validate a broken process. Reflect on them in the trade's What to Improve notes.

CHAPTER 8

Journal & Mic Dictation

Daily journal

- **Pre-Session Readiness** — sleep quality, external stress, physical state (feeling poorly, tired or distracted), your main psychological risk today and what you'll do if you hit your loss limit, with a readiness score.
- **Pre-Session Notes** and **Today's Success Criteria**.
- **Discipline Score** — entry, exit, size and session, each 1–10, and an overall score.
- **Emotional State** — Confident, Calm, Neutral, Anxious or Frustrated.
- **Did You Meet Your Criteria?** — Met, Partly or Missed — and the **Post-Session Review**.
- **No Trades Today**, with a reason, for days you stayed out.

Click **Save Journal Entry** when done. On a No Trades Today day you can still attach the chart you were watching: drop it, browse, or paste with Ctrl + V.

Weekly journal

What Worked Well, What to Change and Focus for Next Week, then a **Sunday Psych Review**: biggest psychological win, most expensive psychological mistake, primary emotional trigger (fear, greed, hope or regret), a concrete behavioural adjustment and your confidence trend. Last week's focus comes back at the top of the new week with **Did it happen?** — Kept it, Partly or Missed it — alongside that week's evidence.

Monthly journal

Monthly Reflection and Goals for Next Month, next to the month's totals.

Mic Dictation

Speak instead of typing in the journal boxes and the trade's notes. Dictation runs **entirely on your PC**: Clarity records your microphone and turns your speech into text itself, and the audio is never sent anywhere or saved. It knows trading words — MES, VWAP, HOD, LOD, FOMO, P&L and the like.

1. Go to **Setup** → **Preferences** → **Mic Dictation** and switch it on.
2. The first time, Clarity downloads its speech model once — about 290 MB, OpenAI's Whisper (English), from Hugging Face — and checks it before use. After that dictation works offline.
3. Click where you want the text, then the **mic button** in the corner of the box. Speak, and click it again to stop.
4. After a moment ("Transcribing…") the text appears where your cursor was.

> **TIP**
> Windows may ask whether Clarity can use the microphone. If dictation says it can't open the microphone, allow "Let desktop apps access your microphone" in Windows Settings → Privacy & security → Microphone.

CHAPTER 9

Risk Calculator

Position Sizing

- Enter your **Account / Max DD** and **Risk Per Trade** in money, or fill both from a real account with **Apply Account**. Clarity works out your risk percentage and how many losses in a row would blow the account.
- **Order Size** — pick an instrument and type the entry and stop prices to get the size in contracts (or units and lots for forex), the risk per contract, and the actual risk against your plan.
- **Chance of N Straight Losses in 100 Trades** — for win rates from 35% to 100%, how likely that losing run is.
- **Consecutive Loss Risk** — a heatmap of streak risk across win rates, with your own row highlighted.
- A **Risk Per Trade Guide** from conservative to extreme.

Edge Check

Is your edge working *now*? Edge Check follows your win rate over a rolling window of 10, 20, 30 or 50 trades as a confidence band against the win rate you need to break even, and gives a verdict: **Edge confirmed**, **Not proven**, **Negative edge** or **No reading** yet. It also shows what the same win rate is worth at different reward-to-risk ratios.

CHAPTER 10

News Squawk

Live market headlines inside Clarity, arriving automatically while the app is open. Choose a view — **Feed**, **Tape** or **Desk** (headlines grouped into stories by theme) — and filter by **Topic** (Geopolitical, Macro, Earnings, General) and **Impact**. The **Economic Calendar** rail shows today's and tomorrow's events with impact and currency filters; released events stay for 15 minutes, dimmed. News Squawk is shown for live trading files only.

CHAPTER 11

Forex & Currency Conversion

Clarity calculates profit and loss the way your broker does: the price difference times the size, converted from the instrument's currency into your account's currency at the rate when the trade closed — realised profit doesn't exist until the position is shut. This applies to forex pairs and to futures priced in a currency other than the account's.

Historical rates, fetched and locked

With the FX Conversion panel on **Auto**, **Fetch** pulls the historical rate for the close date. The rate is stored on the trade and won't drift as rates change later.

Correcting a rate against your broker statement

1. On the trade's Execution tab, switch the FX Conversion panel to **Manual** and type the rate, or
2. Turn on the **FX Rate** column in the Trade List (Chapter 4) and correct trades row by row, straight down your statement.

P&L recalculates with the corrected rate, and the rate is remembered as your own.

Filling in missing rates in bulk

Setup → FX rates → Recalculate FX Conversions → Recalculate FX P&L finds trades in the current file with no rate, fetches and locks one, and recalculates their P&L. Rates already stored — including ones you typed by hand — are left exactly as they are, so it is safe to run after an import.

> **IMPORTANT**
>
> **Re-fetch all rates...**, next to it, is different: it replaces *every* rate in the file, including the ones you corrected by hand, and asks you to confirm first. Use it only if you want to start the rates over.

CHAPTER 12

Importing Trades

Setup → Import & NinjaTrader has two ways to bring trades in: a CSV file, and NinjaTrader Auto-Log.

CSV import

One template covers futures and forex; mixed files are fine, because each row follows its own instrument.

1. **Download Template** saves `clarity-import-template.csv` with one futures and one forex example row.
2. Fill it in from your broker's export. The size column is contracts for futures and units for forex.
3. **Import CSV** picks the file; set **Date Format** if your dates are ambiguous (Auto-detect reads them day-first).
4. **Analyse** shows a Review: ready to import, errors, duplicates skipped, and what will be auto-created (brokers, instruments, accounts, strategies) — untick anything you don't want.
5. **Import N Trades**. Duplicates are skipped, so re-running the same file is safe.

Clarity refuses rather than guesses when something it needs is missing: a futures instrument with no dollar value per point is skipped until you set it in Setup → Instruments, and a forex row that would create a new account needs an `account_currency`. Live files need an account and broker (forex rows don't need a broker); backtest files need neither. Historical FX rates are fetched after the import — if you're offline, run Recalculate FX P&L later (Chapter 11).

Undo a recent import deletes trades imported in the last 15 minutes, hour, 6 hours or 24 hours — preview first, then delete.

NinjaTrader Auto-Log

If you trade through NinjaTrader with the **TradePanelPro** companion indicator, Clarity can bring your trades in automatically — no export, no CSV, no retyping.

Setting it up

1. In TradePanelPro's indicator settings, turn on **Enable Clarity Sync**.
2. On the panel itself, click the **Clarity** pill to start logging.
3. In Clarity, open **Setup → Import & NinjaTrader** and switch on the **NinjaTrader Auto-Log** card.
4. Choose **Import into** — the trading file new trades land in. It is fixed on purpose, so browsing another file while a trade closes can never misfile it.

While Clarity is open it checks for new trades every minute, or click **Scan Now**. **NT Sync Active** shows in the sidebar while the feed is on — hover it to see which file it imports into, click it to change.

Real fills, every account

Auto-Log records the actual fills NinjaTrader reports for each account the panel trades — not the panel's intended price. Manual closes, stop-outs and trades taken while you weren't watching are all captured, with each account's own slippage. When TradePanelPro knows the chart's timeframe (5m, 2000t, 8rk Renko and so on) it fills the trade's Timeframe too; change it in the Trade Log and Clarity never overwrites it.

Copied trades arrive linked

If you copy-trade across several accounts, the trades from one signal arrive already linked (Chapter 5) — journal once and update every account's copy, while each keeps its own result.

Account names and aliases

If you've given an account a display name in TradePanelPro, it's used when Clarity first creates that account — so it shows as "T150 (293)" rather than a raw account number. The real NinjaTrader name is kept underneath and is what matching uses, so trades always land in the same account. New accounts start in USD with a zero balance: set the starting balance in Setup → Accounts.

Checking the log

View log, next to Scan Now, lists every trade TradePanelPro has written, newest day first, with its status in the Import into file. If a trade is missing from Clarity, look for it here first: **if it isn't listed, TradePanelPro never wrote it** — check the Clarity pill is on, Enable Clarity Sync is ticked, and the account is ticked in the panel's accounts list.

A trade marked **Trade missing** was imported once and is no longer in the file — usually deleted. Select it and click **Re-sync selected** to bring it back. A trade that is still there is never re-synced, so nothing is duplicated. **Delete from file** removes lines from the log itself (a backup copy is saved next to it first); it never touches trades already in Clarity.

CHAPTER 13

Cloud Sync

> **PREMIUM FEATURE**
>
> Cloud Sync is available on licences it has been enabled for; the Setup section only appears when yours includes it.

Cloud Sync keeps every installation of Clarity on your licence up to date — log a trade at the office, pick up where you left off at home, with nothing to copy by hand.

Your data stays private

Before anything is uploaded, your data is encrypted on your own machine with a passphrase only you know. Clarity's servers only ever store that encrypted file — nobody, including whoever provided your licence, can read it. Use the same passphrase on every machine.

Turning it on

Setup → Cloud sync: enter a **Sync Passphrase** and click **Enable Cloud Sync**. Repeat on each machine with the same passphrase.

Auto Sync

With **Sync automatically** on (the default), Clarity uploads your changes in the background while you work, only when something changed, and syncs once more when you close — a brief "Syncing with cloud" message, with **Close without**

waiting if you're in a hurry. With it off, use **Sync Now**; closing with unsynced changes offers **Sync & Close**.

Newer data from another machine

If another machine synced newer data, Clarity tells you when it starts and offers **Load Latest & Restart** (a local backup is kept first). If both machines changed something, a **Sync conflict** dialog asks which to keep — **Keep this machine** or the other — rather than overwriting either silently.

Restoring an earlier sync

Show earlier syncs lists up to four recent versions with machine, date and size; the current one is marked. Restoring one needs a restart, then **Sync Now** makes it current for your other machines.

Forgotten your passphrase?

Your local data is unaffected. On the machine that holds the data you want to keep, use **Forgotten your passphrase?** → **Reset passphrase**: enter a new passphrase twice, confirm that this machine's data is the copy to keep, then **Set passphrase and upload**. Then, on each other machine before changing anything: **Disable Sync**, enter the same new passphrase, **Enable Cloud Sync**, then **Sync Now**. It reports a sync conflict — keep the other machine, not **Keep this machine**, or that machine's old data replaces what you just uploaded.

Working offline

Without internet Clarity works as normal and shows **Sync disconnected** in the sidebar. Your changes stay safe and sync once you're back online.

CHAPTER 14

AI Connections

Connect the AI app you already use — Claude Desktop, Claude Code, Cursor, VS Code, Codex, Gemini CLI, LM Studio and others — to Clarity, then ask it about your trading in plain English: "*How did I do after a losing day this month?*", "*Which strategy has the best win rate on MES?*", "*What did my journal say on my worst days?*"

What it can and can't do

- **Read-only.** Your AI can read your trades, accounts and balances, strategies, statistics, tags and journal entries. It can never add, change or delete anything.
- **Local.** It only answers apps on this PC, and only while Clarity is open. Nothing passes through Clarity's servers. It can't see your licence, sync passphrase or settings.
- **Your AI company sees what your AI reads** (Anthropic, OpenAI, Google…), under their terms.
- Answers come from your AI, not from Clarity — check important figures.

Turning it on

1. Open **Setup** → **AI Connections**. It is off by default.
2. Read **Before you connect your AI**, tick **I understand**, then **Turn on**.
3. Under **Which AI app do you use?** pick your app. Clarity shows how it works with that app before you start.
4. Choose when the token expires (30 days, 6 months, 1 year or never) and click **Create token**.
5. The token is shown **once**, already filled into your app's settings — copy it, follow the numbered steps, then **I've copied it — done**.

Claude Desktop

Click **Save Claude Desktop extension…**, drag the saved file into Claude Desktop, paste your token where it asks for the Clarity token, and start a new chat. Claude warns that the extension isn't verified by Anthropic — it shows that for every extension installed from a file.

Managing connected apps

The table lists each connected app with when it was created, last used and when it expires. **Reset** issues a new token (the old one stops working at once); **Revoke** disconnects the app. Tokens belong to this computer — they aren't in backups or Cloud Sync.

> **IMPORTANT**
> Keep your token private — anyone with it can read your journal through this PC while Clarity is open. If you think it has leaked, Reset or Revoke it.

Not possible: ChatGPT and claude.ai in a web browser — they connect from their company's servers, which can't reach Clarity on your PC. Use Codex or Claude Desktop instead.

CHAPTER 15

Setup — Configuration Reference

Setup has a menu on the left in four groups, and **Search settings** (Ctrl + K) to jump straight to any setting.

Section	What it covers
THIS TRADING FILE	
Accounts	Name, alias (the name shown everywhere; the real name is kept for imports), currency, starting balance, and prop-firm rules — max drawdown, trailing, daily loss, profit target — behind the Dashboard's gauges.
Strategies & rules	Your strategies and each one's execution checklist, the Global default rules, copying rules between strategies, renaming and deleting.

Journal tags	Positive and negative tags; negative tags carry a fear / greed / hope / regret category.
Custom filters	Up to 20 named filter dimensions, plus Tidy Up to merge, rename, move or clear values.
MARKETS · ALL FILES	
Instruments	Futures (value per point, tick size, margin) and forex pairs (pip size, lot units).
Commissions	Commission per broker and instrument. Commission is per side and doubled automatically for the round trip.
FX rates	Rate source, current rates, manual overrides, and Recalculate FX P&L / Re-fetch all rates (Chapter 11).
DATA	
Trading files	New files, Live or Backtest, the default file, a backtest's broker and starting balance, and the Showcase file (Chapter 2).
Import & NinjaTrader	CSV import and NinjaTrader Auto-Log (Chapter 12).
Backups	Manual and automatic backups, and restoring (Chapter 16).
Cloud sync	Chapter 13. Shown when your licence includes it.
Export	Export Trades CSV and Export Daily Journal CSV.
Maintenance	Scan for duplicates, and Factory Reset.
APP	
Preferences	Light or dark mode, Display Size, date format (US / UK / ISO), currency symbol, and Mic Dictation (Chapter 8).
AI Connections	Let your own AI app read Clarity (Chapter 14).

CHAPTER 16

Backups & Data Safety

Clarity takes an automatic backup the first time you open it each day and keeps the 14 most recent. Backups stay on this computer.

Manual backup

Setup → Backups → Back Up Now..., then choose a folder. Clarity writes a `clarity-backup-…` folder holding all your trading files and screenshots — worth doing before a big change such as a bulk import, and worth copying somewhere off this PC.

Restoring

Restore from Backup… (choose a backup folder), or **Restore** next to one of the automatic backups. A restore replaces all of Clarity's data with the backup's, and Clarity restarts to load it.

> **TIP**
> A safety copy of your current data (`pre-restore-…`) is always taken before a restore runs, so restoring the wrong backup by mistake is itself recoverable.

CHAPTER 17

Getting Help

If something in Clarity isn't behaving as this manual describes, start with these checks:

1. Confirm you're on the latest version — Clarity shows an update prompt at start-up, and an "Update available" line in the sidebar if you put one off.
2. Check you're looking at the trading file you expect — it's shown in the Active List at the top of the sidebar.
3. If a number looks wrong, check the filters (the Filter Sidebar, or the Trade List's dropdowns) and whether the trade is marked Exclude.
4. For currency questions, check the trade has a locked exchange rate (Chapter 11).

For anything else, contact whoever provided your Clarity licence — they can help directly or pass along a bug report.
